SIGNTRADE presents degassed inks at FESPA 2015 in Cologne

At FESPA 2015 in Cologne SIGNTRADE will focus on degassed ink solutions for the new Epson DX-6 and DX-7 print heads. All high resolution inks S10, E10 and E12 are now available in degassed cartridges and degassed 1 litre bags. Degassing improves nozzle stability and allows highest print speeds with best picture quality.

After introduction of the innovative Emerald E12 ink at Fespa 2011 in Hamburg, the E12 became in the last 4 years a market leader in the alternative ECO solvent market with over 1000 installations in Europe. These TRUeco inks only contain non hazardous air polluting substances (Non-HAPS). The fast drying E12 is perfect for the new fast printers with 2 Epson DX-7 print heads (Roland XF, Valuejet 1638). With degassed inks the high speed modes can be used without any nozzle drop outs during printing.

The low smelling Emerald E10 inks were developed to meet the future requirements for Xi rating as well. E10 is not classified as hazardous and similar to OEM ink formulations like ECO-Sol Max from Roland or ECO Ultra from Mutoh. The major feature of the E10 is a very high scratch and scuff resistance. Therefore E10 can replace former hard solvent products and meets at the same time the future ECO solvent regulations. This makes E10 a very unique product in the market.

As the master distributor for NUtec in Europe, SIGNTRADE also presents new UV and SWF inks. The UV inks will be presented on two SIGNRACER hybrid and flatbed printers.
