Signracer with new LED and new UV inks at FESPA 2014

SIGNTRADE is celebrating its 10 years anniversary this year. At FESPA 2014 in Munich SIGNTRADE will present the UV printer Signracer 1610 LED with a new high performance LED lamp. The LED system was developed together with the new ink Amethyst A50-UV-MPX-TR for fast curing and best adhesion. Amethyst A50-UV-MPX-TR ink is setting a new standard for highest adhesion without primer on rigid materials in the industry.

After introduction of the innovative Nutec Emerald E12 ink at Fespa 2011 in Hamburg, the E12 became in the last 2 years a market leader in the alternative ECO solvent market with over 1000 installations in Europe. These TRUeco inks only contain non hazardous air polluting substances (Non-HAPS). The fast drying E12 is perfect for the new fast printers with 2 Epson DX-7 print heads, like the Signracer 163X. At FESPA the Signracer163X is printing with degassed E12 inks to demonstrate the highest speed modes.

The new Emerald E10 inks were developed to meet the future requirements for Xi rating as well. E10 is not classified as hazardous and similar to OEM ink formulations like ECO-Sol Max from Roland or ECO Ultra from Mutoh. The major feature of the E10 is a very high scratch and scuff resistance. Therefore E10 can replace former hard solvent products and meets at the same time the future ECO solvent regulations. This makes E10 a very unique product in the market.

As the master distributor for Nutec in Europe, SIGNTRADE also presents new SWF inks. The Topaz T53-XLF was developed for XL-Jets and the T51N is a low viscosity ink for printer with 30-80 ptl print heads.
